**Description**Technical Field

- 5 [0001] This invention relates to an organic solvent-soluble phenylene-containing polymer which has high heat resistance, low dielectric properties, and excellent processability.

Background Art

- 10 [0002] Reflecting the advancement of fine processing technology, large scale integration (LSI) has ever been increasing in integration, function, and performance. As a result, the circuit resistance and condenser capacitance between interconnection lines (called parasitic resistance and parasitic capacitance, respectively) increase to increase not only power consumption but retardation time, which is a great cause of reduction of signal speed of a device.

- 15 [0003] It has therefore been demanded to reduce parasitic resistance or parasitic capacitance. One of the solutions is to cover the peripheries of interconnection lines with an interlayer dielectric film to reduce the parasitic capacitance so as to cope with speeding up of devices. In this case, the interlayer dielectric film must have excellent heat resistance withstanding a thin film formation step for producing a mounting substrate or post steps, such as chip bonding and pin insertion mounting.

- 20 [0004] Polyimide is widespread as a highly heat-resistant organic material for this use but, containing a highly polar imido group, unsatisfactory from the standpoint of low dielectric properties and low water absorbability.

- [0005] On the other hand, polyphenylene is known as a heat-resistant organic material containing no polar group. Because polyphenylene is, while excellent in heat resistance, inferior in solubility in organic solvents, it is a practice generally followed to introduce a side chain. Polyphenylene having a side chain includes polymers described in U.S. Patents 5,214,044, WO 96/28491, and EP 629217.

- 25 [0006] These polymers have a basic structure mainly comprising a poly-p-phenylene structure and, in some cases, a flexible monomer unit. They are soluble only in specific organic solvents and have poor processability. Besides, many of them carry a polar group or an alkyl group as a side chain and therefore fail to fully satisfy the requirements of heat resistance and low dielectric properties.

- 30 [0007] Further, most of these conventional polymers are produced by starting with aromatic dichloro compounds such as p-dichlorobenzene derivatives. When a fluoroalkyl group or an aryl group is to be introduced as a side chain in an attempt to obtain a heat-resistant low-dielectric material from such an aromatic dichloro compound, there are accompanying disadvantages, such that the synthesis of the monomer becomes complicated, the monomer cannot be secured in a stable manner, and the degree of polymerization does not rise sufficiently on account of the steric hindrance of the side chain.

- 35 [0008] Thus there has been found no polyphenylene that could fulfill the requirements of heat resistance, low dielectric properties and processability and that could be produced economically.

Disclosure of the Invention

- 40 [0009] An object of the present invention is to overcome the above-mentioned problems and to provide a soluble resin excellent in heat resistance, low dielectric properties, processability and transparency.

- [0010] The present invention provides a process for producing a phenylene-containing polymer comprising polymerizing a monomer comprising not less than 50 mol% of a compound represented by formula (I):

[0017] In the present invention, two or more compounds represented by formula (I) can be copolymerized.

[0018] The compound of formula (I) is synthesized by, for example, the following process.

[0019] A bisphenol compound (e.g., 2,2-bis(4-hydroxyphenyl)hexafluoropropane) and two or more equivalents of a base are dissolved in a solvent. Pyridine can serve as both a base and a solvent. If desired, a catalyst such as 4-dimethylaminopyridine can be added.

[0020] A sulfonic acid chloride (or anhydride) (e.g., methanesulfonic acid chloride) is added dropwise to the solution over a period of 5 to 60 minutes in a dry nitrogen stream while maintaining the solution below 15°C, followed by stirring at the same temperature for 0 to 60 minutes. The stirring is continued at room temperature for 0 to 24 hours to prepare a suspension. The resulting suspension is reprecipitated in 3 to 20 times as much ice-water as the suspension. The precipitate is collected and further purified by, for example, recrystallization to give bisulfonate compound crystals.

[0021] Alternatively a bisphenol compound (e.g., 2,2-bis(4-hydroxyphenyl)hexafluoropropane) is dissolved in 2 equivalents of an alkali aqueous solution, such as a sodium hydroxide aqueous solution. Separately, a sulfonic acid chloride (or anhydride) (e.g., methanesulfonic acid chloride) is dissolved in an organic solvent, such as toluene or chloroform. The two solutions are mixed and vigorously stirred in the presence of, if desired, a phase transfer catalyst, such as acetyltrimethylammonium chloride. The organic layer of the resulting reaction mixture is purified to yield a desired bisulfonate compound.

[0022] The compound of formula (I) can be copolymerized with at least one compound selected from compounds represented by formulae (II) to (VI) shown below.

[0042] The catalyst system which can be used in the production of the phenylene-containing polymer of the present invention contains a transition metal compound. The catalyst system essentially comprises (1) a combination of a transition metal salt and a ligand or a transition metal (or salt) having a ligand coordinated thereto and (2) a reducing agent. The catalyst system may further contain a salt to increase the rate of polymerization.

[0043] The transition metal salt includes nickel compounds, such as nickel chloride, nickel bromide, nickel iodide, and nickel acetylacetonate; palladium compounds, such as palladium chloride, palladium bromide, and palladium iodide; iron compounds, such as iron chloride, iron bromide, and iron iodide; and cobalt compounds, such as cobalt chloride, cobalt bromide, and cobalt iodide. Preferred among them are nickel chloride and nickel bromide.

[0044] The ligand includes triphenylphosphine, 2,2'-bipyridine, 1,5-cyclooctadiene, and 1,3-bis(diphenylphosphino)propane, with triphenylphosphine and 2,2'-bipyridine being preferred. These ligands may be used either individually or as a combination of two or more thereof.

[0045] The transition metal (or salt) having a ligand coordinated thereto includes di(triphenylphosphine)nickel chloride, di(triphenylphosphine)nickel bromide, di(triphenylphosphine)nickel iodide, di(triphenylphosphine)nickel nitrate, 2,2'-bipyridinenickel chloride, 2,2'-bipyridinenickel bromide, 2,2'-bipyridinenickel iodide, 2,2'-bipyridinenickel nitrate, bis(1,5-cyclooctadiene)nickel, tetrakis(triphenylphosphine)nickel, tetrakis(triphenylphosphite)nickel, and tetrakis(triphenylphosphine)palladium, with di(triphenylphosphine)nickel chloride and 2,2'-bipyridinenickel chloride being preferred.

[0046] The reducing agent to be used in the catalyst system of the present invention includes iron, zinc, manganese, aluminum, magnesium, sodium and calcium, with zinc and manganese being preferred. These reducing agents can be activated on contact with an acid or an organic acid.

[0047] The salt which may be used in the catalyst system includes sodium compounds, such as sodium fluoride, sodium chloride, sodium bromide, sodium iodide, and sodium sulfate; potassium compounds, such as potassium fluoride, potassium chloride, potassium bromide, potassium iodide, and potassium sulfate; and ammonium compounds, such as tetraethylammonium fluoride, tetraethylammonium chloride, tetraethylammonium bromide, tetraethylammonium iodide, and tetraethylammonium sulfate. Sodium bromide, sodium iodide, potassium bromide, tetraethylammonium bromide and tetraethylammonium iodide are preferred of them.

[0048] The transition metal salt or transition metal (salt) having a ligand coordinated thereto is generally used in an amount of 0.0001 to 10 mol, preferably 0.01 to 5 mol, per mole of the compound of formula (I) or a monomer mixture of the compound of formula (I) and the compound represented by formulae (II) to (V) (hereinafter inclusively referred to as "the total monomer"). If the amount of the transition metal component is less than 0.0001 mol, the polymerization reaction does not proceed sufficiently. If it exceeds 10 mol, the molecular weight is reduced.

[0049] Where a combination of the transition metal salt and the ligand is used, the ligand is usually used in an amount of 0.1 to 100 mol, preferably 1 to 10 mol, per mole of the transition metal salt. If the amount of the ligand is less than 0.1 mol, the catalyst activity is insufficient. If it is more than 100 mol, the resulting polymer is difficult to purify.

[0050] The reducing agent is usually used in an amount of 0.1 to 100 mol, preferably 1 to 10 mol, per mole of the total monomer. If the amount of the reducing agent is less than 0.1 mol, the polymerization reaction does not proceed sufficiently. If it is more than 100 mol, the resulting polymer is difficult to purify.

[0051] In using a salt in combination with the above essential components, the salt is usually used in an amount of 0.001 to 100 mol, preferably 0.01 to 1 mol, per mole of the total monomer. If the amount is less than 0.001 mol, the effect in increasing the rate of polymerization is insufficient. If it exceeds 100 mol, the resulting polymer is difficult to purify.

[0052] Polymerization solvents which can be used in the present invention include tetrahydrofuran, cyclohexanone, dimethyl sulfoxide, N,N-dimethylformamide, N,N-dimethylacetamide, 1-methyl-2-pyrrolidone,  $\gamma$ -butyrolactone, and  $\gamma$ -butyrolactam. Tetrahydrofuran, N,N-dimethylformamide, N,N-dimethylacetamide, and 1-methyl-2-pyrrolidone are preferred. It is preferred for these solvents to be dried thoroughly before use.

[0053] The total monomer concentration in the polymerization system is usually from 1 to 100% by weight, preferably 5 to 40% by weight.

[0054] The polymerization is usually carried out at a temperature of 0 to 200°C, preferably 50 to 90°C, for a period of 0.5 to 100 hours, preferably 1 to 40 hours.

[0055] The phenylene-containing polymer obtained by the process of the present invention comprises not less than 50 mol% of a repeating unit represented by formula (VII):

10 [0059] The phenylene-containing (co)polymer according to the present invention provides a film-forming material. The film-forming material of the present invention can be obtained by a method comprising melting the phenylene-containing (co)polymer in a powder form and pressing or injection molding the molten polymer into film or a method comprising dissolving the phenylene-containing (co)polymer in a solvent, casting the polymer solution on a substrate or applying the solution to a substrate by spin coating, followed by baking to remove the solvent.

15 [0060] The powdered phenylene-containing (co)polymer can be melted by heating the polymer to a temperature higher than the softening point usually by 10 to 250°C, preferably by 40 to 150°C.

[0061] Suitable solvents for dissolving the phenylene-containing (co)polymer include tetrahydrofuran, cyclohexanone, dimethyl sulfoxide, N,N-dimethylformamide, N,N-dimethylacetamide, 1-methyl-2-pyrrolidone, γ-butyrolactone, ethylene glycol monomethyl ether, ethylene glycol dimethyl ether, ethylene glycol methyl ethyl ether, ethylene glycol monoethyl ether, methyl cellosolve acetate, ethyl cellosolve acetate, diethylene glycol monomethyl ether, diethylene glycol diethyl ether, diethylene glycol dimethyl ether, diethylene glycol ethyl methyl ether, diethylene glycol monoethyl ether, diethylene glycol monobutyl ether, propylene glycol methyl ether acetate, propylene glycol ethyl ether acetate, toluene, xylene, methyl ethyl ketone, methyl amyl ketone, 4-hydroxyl-4-methyl-2-pentanone, ethyl 2-hydroxypropionate, methyl 2-hydroxy-2-methylpropionate, ethyl 2-hydroxy-2-methylpropionate, ethyl ethoxyacetate, ethyl hydroxyacetate, methyl 2-hydroxy-2-methylbutanoate, methyl 3-methoxypropionate, ethyl 3-methoxypropionate, methyl 3-ethoxypropionate, ethyl 3-ethoxypropionate, ethyl acetate, butyl acetate, methyl lactate, ethyl lactate, chloroform, and methylene chloride. Preferred of them are cyclohexanone, N,N-dimethylacetamide, 1-methyl-2-pyrrolidone, γ-butyrolactone, ethyl 3-ethoxypropionate, ethyl lactate, propylene glycol monomethyl ether acetate, ethylene glycol monoethyl ether acetate, and methyl amyl ketone.

30 [0062] The phenylene-containing (co)polymer is dissolved in the solvent in a concentration of 1 to 60% by weight, preferably 5 to 40% by weight. If the concentration is lower than 1% by weight, a film of sufficient thickness is hardly obtainable. If it is higher than 60% by weight, the solution hardly spreads, failing to provide a uniform film.

[0063] If desired, additives can be incorporated into the phenylene-containing polymer having the repeating unit of formula (VII) or represented by formulae (VIII) to (X). Suitable additives include silane coupling agents, methylol melamine, and bonding aids and crosslinking agents such as triazene compounds.

35 [0064] The phenylene-containing polymers produced by the process of the present invention are useful as an interlayer dielectric film, a protective film, a low-reflective coating, an optical waveguide material, an anti reflection coating, a sealant, an alignment layer for liquid crystal display, a printed circuit board material, a gas-permeable film, and the like. They are particularly suited as an interlayer dielectric film and an optical material.

#### Industrial Applicability

[0096] In the present invention, a monomer prepared by sulfonating an economically available bisphenol compound is polymerized in the presence of a transition metal catalyst. There is produced through an economical process a polymer satisfying the requirements of heat resistance, low dielectric properties, and processability. Further, the polymer provides a highly transparent film.

[0097] Where the above-mentioned monomer is copolymerized with a dihalo- or bissulfonate compound having a reactive functional group or a precursor thereof, copolymers exhibiting solvent resistance and adhesion in addition to the above characteristics can be obtained.
